Color Names and Codes

When you're setting color properties in a form or report in Design view, you normally enter a hexadecimal value that represents the red-green-blue (RGB) color value. You can also generate these values by clicking the Build (...) button next to any color property. When working with controls, you can select colors from the same palette using the Font Color or Fill/Back Color commands in the Font group on the Design contextual tab on the Ribbon. (In Layout view, you can find these commands in the Font group on the Format contextual tab.) When you rest your mouse pointer on one of the color selections, Microsoft Office Access 2007 shows you a color name, but you cannot type the name directly in a color property. The following table lists the color names found in Standard Colors in the first column and the equivalent hexadecimal color code in the third column.

If you design Web pages to work with your Office Access 2007 application, you might want to match the colors used in your design. When designing a Web page, you can use color names that Internet Explorer and most browsers understand and convert to a hexadecimal color code. The second column in the following table lists the color names recognized by Internet Explorer and most other browsers, and the third column lists the equivalent hexadecimal color code. If you want your Web pages to match the color you use in your Access 2007 application design, you can use the Access 2007 color code directly in your Web page design or use the codes for standard Web page colors in color properties in Access 2007.
